## **Instructions for Collecting Water Samples**

### **Disinfect the Sampling Point:**

- The sampling point must be disinfected to prevent contamination.
- This can be done by immersing the tap in an alcohol solution (e.g., isopropanol or spirit) for 2–3 minutes. Alternatively, using a cleaning or disinfectant wipe.

### **Use a Sterile Sampling Container:**

- A sterile container should be used whenever possible.
- If unavailable, a clean mineral water bottle may be used as a substitute.

### **Avoid Contamination:**

- Ensure hands are clean during sampling.
- Avoid contact between the inside of the lid or container and the sampling point.

### **Run Water Before Sampling:**

- Allow the water to run for at least 2–3 minutes before collecting the sample.

### **Refrigerate and Transport Promptly:**

- Keep the samples refrigerated if possible.
- Transport them to the testing laboratory as quickly as possible.

### **Label Samples Clearly:**

- If submitting multiple samples, ensure each sample is distinctly labelled.

### **Recommended Sample Quantities:**

- **Chemical Drinking Water Analysis:** 1 litre
- **Physico-Chemical Drinking Water Analysis:** 1 litre
- **Microbiological Drinking Water Analysis:** 0.7 litres
- **Water Profiles:** 1 litre
